Office Action Summary

Application No.

09/996,423

Applicant(s)

WHITMAN ET AL.

Examiner

Thanh V Pham

Art Unit

2823

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 18 August 2004.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-4, 7-11, 14-16 and 20-32 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-4, 7-11, 14-16 and 20-32 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____

DETAILED ACTION

1. In view of the Appeal Brief filed on 08/18/04, PROSECUTION IS HEREBY REOPENED. A Rebuttal to the Reply Brief is set forth below.

To avoid abandonment of the application, appellant must exercise one of the following two options:

(1) file a reply under 37 CFR 1.111 (if this Office action is non-final) or a reply under 37 CFR 1.113 (if this Office action is final); or,

(2) request reinstatement of the appeal.

If reinstatement of the appeal is requested, such request must be accompanied by a supplemental appeal brief, but no new amendments, affidavits (37 CFR 1.130, 1.131 or 1.132) or other evidence are permitted. See 37 CFR 1.193(b)(2).

Claim Rejections - 35 USC § 112

2. Claims 1, 7 and 14 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The term "gradually" in claims 1, 7 and 14 is a relative term which renders the claim indefinite. The term "gradually" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention.

The instant specification's paragraph [0041]:

Art Unit: 2823

By way of example, when ARCH 895 photoresist is used as the mask material, the substrate bearing stacked capacitor structure 10 is spun at a first speed of about 1,000 rpm until a substantially homogeneous layer is formed (e.g., about one second to about five seconds). The spinning rate is then decreased to about 100 rpm for a period of about five seconds to about ten seconds to allow the photoresist within containers 14 to begin setting. The rate at which stacked capacitor structure 10 is spun is then gradually increased to a third speed of at least about 1,500 rpm until the photoresist covering surface 12 reaches a desired, reduced thickness or until the photoresist is substantially removed from surface 12. The spin rate is then decreased again, this time to about 50 rpm, for a duration of about 19 to about 50 seconds to permit additional setting, or casting, of the photoresist.

It is understood from paragraph [0041] that the first speed is 1,000 rpm in about one second to about five seconds, the second speed is 100 rpm for a period of about five seconds to about ten seconds, the third speed is at least 1,500 rpm without stating a duration and the fourth speed is about 50 rpm for a duration of about 19 to about 50 seconds. Paragraph [0041] does not provide the acceleration from the second speed to the third speed. It is not clear at what rate the "gradually increasing" to a third speed is recited in claims 1, 7 and 14. Indefinite Limitations must be Considered, MPEP 2143.02.

Claim Rejections - 35 USC § 102

3. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
4. Claims 1-4 are rejected under 35 U.S.C. 102(a) as being anticipated by Yoshihara U.S. Patent No. 6,117,486.

The Yoshihara reference discloses a coating method (col. 2, line 54 to col. 3, line 9, e.g.) comprising: applying a material to a substrate; spinning said substrate and said material at the first speed; decelerating to the second speed; then accelerating to a third speed. *The rate of increase of the spinning speed disclosed by Yoshihara is encompassed by "gradually increasing" with respected to any faster than disclosed rate of acceleration.* With the same

Art Unit: 2823

procedure, it would have been inherently include in the rotation speeds that the material when spread over the surface of a wafer would fill the recesses at a first speed and would set at a second speed.

Claim Rejections - 35 USC § 103

5. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

6. Claims 1-4, 7-11, 14-16 and 20-32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yoshihara U.S. Patent No. 6,117,486 in combination with Rodrigues U.S. Patent No. 5,405,813 and Wolf, Silicon Processing for the VLSI Era, vol. 1.

The Yoshihara reference discloses a coating method as described above.

The Rodrigues reference discloses a spin coating method comprising: applying a material to a substrate; spinning said substrate and said material at the first speed (abstract); decelerating to the second speed (col. 5, line 34 and col. 6, line 16); then accelerating to a third speed (col. 6, line 16 and line 50). The substrate is accelerated to a fourth speed to further set the material (col. 6, line 53). Rodrigues teaches all steps of the instant invention but lacks a clear teaching on photoresist application, filling recesses at first speed and letting the material set at second speed and the duration of the second speed. Rodrigues reference's related prior art (the Background and col. 4, lines 6-13) also teaches spinning the substrate and the material at a first speed; this teaching corresponds to which called "*static dispense*" by Wolf, page 431 (provided by the applicant and addressed in the previous Office action).

To apply Wolf's "static dispense" step into Rodrigues' and/or Yoshihara's method to have the photoresist on the substrate before said substrate and said material being spun at a first speed would have been obvious to one of ordinary skill in the art at the time the invention was made as the photoresist application on the substrate before said substrate and said material being spun would be selected in order to "provides more uniform coating" (Wolf's last line of the third paragraph on page 431) in spreading the resist material over the substrate with different line widths in accordance with the teaching of Yoshihara and/or Rodrigues.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to employ a duration for each rotating speed of Yoshihara at every speeds in the process of Rodrigues to fill and to set the material into the recess of different linewidths as each speed with a duration of time would be performed in order to improve the controlling of the thickness of the coated film in the process of photoresist dispense method as taught by Rodrigues. Alternatively, it would have been obvious to one of ordinary skill in the art at the time the invention was made to apply the fourth speed of Rodrigues into the process of Yoshihara as the more speed of rotation would be selected in order to further set the material in the recess in accordance with the dispensing method as taught by Yoshihara.

It would have been inherently included in the rotation speeds that the material when spread over the surface of a wafer would fill the recesses at a first speed and would set at a second speed; otherwise, it would have been obvious to one of ordinary skill in the art at the time the invention was made to apply the appropriate speeds for the two rotations to have the material fill the recess and to set into the process of Yoshihara (col. 1, line 63 to col. 2, line 1)

Art Unit: 2823

because such rotation speeds would have been selected in accordance within the spin coating art in order to have a desired coating thickness as taught.

As admitted (specification's page 13, lines 7-8), the edge bead removal technique is known; therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to apply the fifth speed to remove the solvent from said material because such an extra step would have been applied as one of the method to rinse off the solvent use in the bead removal.

Response to Arguments

7. Applicant requests a reversal of the of claims 1, 7 and 14 under 35 USC 112, second paragraph based on MPEP 2173.05(b) with the analysis from page 8 through page 11 in the argument. The examiner does not agree by the following reasons.

Firstly, in accordance to that section of MPEP and applicant's statement "the term 'gradually' is a relative term", which is acceptable if one of ordinary skill in the art would readily understand its meaning in light of the specification", the examiner tries to look in the specification but finds no factually supported objective evidence for this relative term. Paragraphs [012], [0014], [0019] and [0040], after the term "gradually increased", add "or ramped up" as an explanation without giving any further value(s) or number of rotation per unit of time. The most detailed paragraph [0041] (quoted in the above rejection under 35 USC 112, second paragraph) does not disclose any further regular or continuous value(s) or number of acceleration/deceleration per unit of time or, at least, a time frame from one speed to another for the claimed "gradually increasing"

Art Unit: 2823

term. Instead of correctly quotes [0041] (the substrate bearing stacked capacitor structure 10 is spun at a first speed of about 1,000 rpm ... The spinning rate is then decreased *to about 100 rpm for a period of about five seconds to about ten seconds*), applicant *restates* the above statement as “the rate at which a substrate is spun may be decreased from a first speed of about 1,000 rpm to a second speed of about 100 rpm over a period of about five seconds to about ten second” and uses the time period for the second spin rate as the incorrect time period for the change in speed between first and second rates to calculate the deceleration. It is clear that “*a period of about five seconds to about ten seconds*” in [0041] is the time frame in which the second speed is performed, not the time frame in which the first speed is changed to the second speed to make the faulty calculation in page 9 of the argument.

Secondly, the rejection under 35 USC 112, second paragraph is based on the “gradually increasing a rate of the spinning to a substantially constant third speed” in claim 1, “gradually increasing a rate of spinning of the substrate to a third speed” in claims 7 and 14, not the gradually decreasing from the first speed to the second speed. Therefore, the argument based on the decreasing from the first to the second speeds is irrelevant to the rejection.

Finally, in accordance to the second part of that extracting section of MPEP, it is agreed that the term “gradual” is defined as “advancing or progressing by regular or continuous degrees” as in the American Heritage College Dictionary; therefore, the regular or continuous 20,000 rpm per second of Wolf (provided by the applicant) has been suggested as an adequate compromise spin-ramp with respect to various variable parameters or

Art Unit: 2823

Yoshihara's acceleration/deceleration (related tables in cols. 9 and 10) of 10,000/30,000 rpm per second wherein a number of rpm/sec is provided as a regular or continuous degrees of acceleration/deceleration from one speed to another speed **or** Yonaha's time frame of 2 seconds for changing the speed from 1,000 rpm to 5,670 rpm (calculated by the applicant). Gradually or not gradually, the Wolf, Yoshihara and the Yonaha all provide a degree of rpm over a time period for their acceleration/deceleration while the instant specification does not.

At least for the above reasons, the rejection under 35 USC 112, second paragraph is maintained as stated in the previous Office Action mailed 10/21/03 and repeated herewith.

8. In response to applicant's argument on the validity of "gradually increasing" of Yoshihara on pages 12-14 in the rejection under 35 USC 102(a), and in accordance with applicant's statement "the term 'gradually' is a relative term" in applicant's argument, page 9, the last 3 lines, the examiner considers the rate of increase of the spinning speed disclosed by Yoshihara is encompassed by "gradually increasing" relative to any faster than disclosed rate of acceleration. Moreover, the acceleration of Yoshihara at 10,000rpm/sec can be considered 'gradually' relative to Yoshihara deceleration at 30,000 rpm/sec ("drastically reduced", col. 10, lines 10-11). Yoshihara does not consider 10,000 rpm/sec as "drastically" increase. The argument on the deceleration is again irrelevant as in the above.

With respect to claims 2-3, the inherency of filling the recesses by the material in the first speed and the material being set in the second speed that would be obtained by the same performed process steps. Yoshihara discloses the different characteristics of "low-viscosity material, compared to the conventionally-used resist film" in col. 1, lines 58-59 and

Art Unit: 2823

continues that "it is also necessary to control the rotational speed of the semiconductor wafer to set the same at a speed which permits the resist solution to dry with such a timing that the concentric circular ripple of the resist solution reaches and passes the edge of the semiconductor wafer" (col. 1, line 63 to col. 2, line 1). The purpose of the Yoshihara reference ("*the wafer can be coated with material in such a way that circular ripples do not appear thereon*", applicant's argument, page 12) does not have to be the same as the instant invention inasmuch as it provides the same procedure, MPEP 2131.05.

Arguments that the alleged anticipatory prior art is nonanalogous art' or teaches away from the invention' or is not recognized as solving the problem solved by the claimed invention, [are] not germane' to a rejection under section 102." *Twin Disc, Inc. v. United States*, 231 USPQ 417, 424 (Cl. Ct. 1986) (quoting *In re Self*, 671 F.2d 1344, 213 USPQ 1, 7 (CCPA 1982)).

Furthermore, applicant has never traversed Yoshihara's steps of applying a material to a substrate and spinning said substrate and said material at the first speed in the rejection.

Therefore the rejection under 35 USC 102(a) in the previous Office Action is maintained.

9. Applicant's arguments with respect to claims 1-4, 7-11, 14-16 and 20-23 rejected under 35 USC 103(a) have been considered but are moot in view of the new ground(s) of rejection.

(Note: in the rejection under 103(a) based on Rodrigues, the examiner considers two different combinations. One is viewed from Rodrigues' method itself and another is in view of a combination of Rodrigues' method with related prior art recognized by Rodrigues. The former is stated: "*At any point, during the photoresist applying step, it would be considered that an amount of photoresist material has been applied and is being spun at a first speed*

Art Unit: 2823

followed by decreasing the speed". The latter is Rodrigues' related prior art, which called "*static dispense*" by Wolf, page 431, and is used in the rejection which is not addressed in applicant's argument. This "*static dispense*" when combined to Rodriguez would provide 'spinning the material and the substrate at a substantially constant first speed' as claimed. Another interesting concept about "froze in time" that the applicant at least mention twice from pages 18 to page 27 in the argument on the rejection under 35 USC 103, the examiner would like to provide some passages from a Physic textbook which is attached herewith.)

Conclusion

10. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

11. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Thanh V. Pham whose telephone number is 571-272-1866. The examiner can normally be reached on M-T (6:30-5:00).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Olik Chaudhuri can be reached on 571-272-1855. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
